 AB Immunisation against the mycobacterial heat shock protein (hsp-65) has  
 been proposed to lead to production of autoantibodies against human  
**lactoferrin**. Such **antibodies** occur in ulcerative colitis  
 and in primary sclerosing cholangitis. This study analysed the  
 distribution of hsp-65 and **lactoferrin** in biopsy specimens from  
 patients with **inflammatory bowel** disease and primary  
 sclerosing cholangitis and studied whether immunisation against  
 mycobacterial hsp-65 resulted in production of antilactoferrin  
**antibodies** and vice versa. **Polyclonal** rabbit antihuman  
**lactoferrin** and monoclonal mouse anti-hsp-65 (ML30) were used for  
 immunohistochemistry on biopsy specimens from patients with  
**inflammatory bowel** disease and primary sclerosing  
 cholangitis. Rats were immunised against human **lactoferrin** and  
 mycobacterial hsp-65 respectively. **Antibody** measurements were  
 done by enzyme immunoassays. It was found that **lactoferrin**  
 and hsp-60/65 were not codistributed. **Lactoferrin** was found on  
 vascular endothelium and in nonparenchymal liver cells both in inflamed  
 and uninflamed tissues, but only in the hepatocytes of inflamed Liver.  
 ML30 reactivity was not inhibited by antilactoferrin **antibodies**.  
 Rat anti-hsp-65 serum had no detectable antilactoferrin **antibodies**  
 . In conclusion, antilactoferrin **antibodies** probably do not  
 arise by immunisation against mycobacterial hsp-65. Both nonparenchymal  
 cells and hepatocytes probably participate in clearance of  
**lactoferrin**. Endothelial exposure of **lactoferrin** may  
 have pathogenic implications in diseases with antilactoferrin  
 autoantibodies.
